DT04 Rec'd PCT/PTO 07 OCT 2004

SMC 60510

Claims (Amended)

1. A toner for developing an electrostatic image comprising toner particles which include a binder resin, a wax and a colorant, wherein the wax has a melting point of between 50 and 150°C, and the wax exists in the toner particles in domains of 2 µm or less mean particle size and wherein
(a) the mean circularity of the toner particles as measured by a Flow Particle Image Analyser is at least 0.90;
(b) the shape factor, SF1, of the toner particles is in the range from 130 to 150; and
(c) the ratio SF1/SF2 of the shape factor, SF1, to the shape factor, SF2, is from 1.07 to 1.13.

2. A toner according to Claim 1 wherein the mean circularity of the toner particles is in the range from 0.93 to 0.99.

3. A toner according to Claim 2 wherein the mean circularity of the toner particles is in the range from 0.94 to 0.96.

4. A toner according to any one preceding claim wherein SF1 of the toner particles is at most 145.

5. A toner according to Claim 4 wherein SF1 of the toner particles is in the range from 135 to 145.

6. A toner for developing an electrostatic image comprising toner particles which include a binder resin, a wax and a colorant, wherein the wax has a melting point of between 50 and 150°C, and the wax exists in the toner particles in domains of 2µm or less mean particle size and wherein
(a) the mean circularity of the toner particles as measured by a Flow Particle Image Analyser is in the range from 0.94 to 0.96;
(b) the shape factor, SF1, of the toner particles is in the range from 135 to 145; and
(c) SF1 > SF2.

7. A toner according to any one preceding claim wherein SF2 of the toner particles is in the range from 120 to 140.

8. A toner according to Claim 7 wherein SF2 of the toner particles is in the range from 125 to 135.

9. A toner according to any one of the preceding Claims wherein the BET surface area of the toner particles before any optional blending with surface additives is 0.5-1.5

SMC 60510

m^2/g.

10. A toner according to Claim 9 wherein the BET surface area of the particles is 0.6-1.3 m^2/g.

11. A toner according to Claim 10 wherein the BET surface area of the particles is 0.7-1.1 m^2/g.

12. A toner according to Claim 11 wherein the BET surface area of the particles is 0.9-1.0 m^2/g

13. A toner according to any one of the preceding Claims wherein the binder resin has a ratio of weight average molecular weight (Mw) to number average molecular weight (Mn) of at least 3.

14. A toner according to Claim 13 wherein the ratio Mw/Mn is at least 5.

15. A toner according to Claim 14 wherein the ratio Mw/Mn is at least 10.

16. A toner according to any one of the preceding Claims wherein the wax exists in the toner in domains of mean diameter 1.6µm or less.

17. A toner according to any one of the preceding Claims wherein the binder resin is prepared from at least one latex containing a resin having a monomodal molecular weight distribution and at least one latex containing a resin having a bimodal molecular weight distribution.

18. A toner according to Claim 17 wherein the monomodal molecular weight resin is a low molecular weight resin and has a number average molecular weight of from 3000 to 10000.

19. A toner according to Claim 18 wherein the monomodal molecular weight resin has a number average molecular weight of from 3000 to 6000.

20. A toner according to any of Claims 17-19 wherein the bimodal resin has a weight average molecular weight of from 100,000 to 500,000.

21. A toner according to Claim 20 wherein the bimodal resin has a weight average molecular weight of from 200,000 to 400,000.

SMC 60510

22. A toner according to any one of the preceding Claims wherein the resin comprises a copolymer of (i) a styrene or substituted styrene, (ii) at least one alkyl acrylate or methacrylate and (iii) an hydroxy-functional acrylate or methacrylate.

23. A toner according to any one of the preceding Claims wherein the wax has a melting point of from 50 to 130°C.

24. A toner according to claim 23 wherein the wax has a melting point of from 50 to 110 °C.

25. A toner according to claim 24 wherein the wax has a melting point of from 65 to 85 °C.

26. A toner according to any one of the preceding Claims wherein the wax comprises a wax selected from the group consisting of: a polyethylene wax, a paraffin wax, a Fischer-Tropsch wax and an ester wax, including Carnauba wax.

27. A toner according to any one of the preceding Claims wherein the amount of wax incorporated in the toner is from 1 to 30 wt% based on the total weight of toner.

28. A toner according to Claim 27 wherein the amount of wax is from 3 to 20 wt%.

29. A toner according to Claim 28 wherein the amount of wax is from 5 to 15 wt%.

30. A toner according to any of the preceding Claims which further comprises a charge control agent.

31. A toner according to claim 30 wherein the charge control agent is colourless.

32. A process for forming an image, the process comprising developing an electrostatic image using a toner according to any one of the preceding claims, wherein the haze at a print density of 1.0 mg/cm^2 is below 40, and the ratio of the values at fusion temperatures of 130 and 160°C is at most 1.5.

33. A process for forming an image according to Claim 32 wherein the ratio of haze values is at most 1.3.

34. A process for forming an image according to Claim 33 wherein the ratio of haze values is at most 1.2.

35. A process for the manufacture of a toner for developing an electrostatic image comprising toner particles which include a binder resin, a wax and a colorant, wherein the

SMC 60510

wax has a melting point of between 50 to 150°C; and the wax exists in the toner particles in domains of 2µm or less mean particle size and wherein

(a) the mean circularity of the toner particles as measured by a Flow Particle Image Analyser is at least 0.90; and

(b) the shape factor, SF1, of the toner particles is at most 165,

which process comprises the following steps:

I. providing a latex dispersion which has at least one latex with a monomodal molecular weight distribution and has at least one latex with a bimodal molecular weight distribution;

II. providing a wax dispersion;

III. providing a colorant dispersion

IV. mixing the latex dispersion, wax dispersion and colorant dispersion; and

V. causing the mixture to flocculate.

36. A process according to Claim 35 wherein the monomodal molecular weight latex has a number average molecular weight of from 3000 to 10000.

37. A process according to Claim 36 wherein the monomodal molecular weight latex has a number average molecular weight of from 3000 to 6000.

38. A process according to any of Claims 35 to 37 wherein the bimodal latex has a weight average molecular weight of from 100,000 to 500,000.

39. A toner according to Claim 38 wherein the bimodal latex has a weight average molecular weight of from 200,000 to 400,000.

40. A process according to any of claims 35 to 39 further comprising heating the flocculated mixture obtained after step (v) to form loose aggregates of particle size from 3 to 20µm.

41. A process according to Claim 40 further comprising heating the aggregates to a temperature above the T_g of the latex to induce coalescence to form toner particles.

42. A process according to Claim 41 further comprising blending the toner particles with one or more surface additives.

43. A process according to any one of Claims 35-42 wherein the latex dispersion comprises an ionic surfactant.

SMC 60510

44. A process according to any one of claims 35-43 wherein the latex containing a resin having a bimodal molecular weight distribution is prepared by a process comprising the successive steps of forming a polymer of high molecular weight distribution followed by forming a polymer of low molecular weight distribution such that the resulting latex comprises composite particles comprising both said low molecular weight polymer and said high molecular weight polymer.

46. A process according to any one of Claims 35 to 44 which, prior to step iv, further comprises the step of providing a charge control agent dispersion, which dispersion is then incorporated in step iv by mixing.

46. A process according to claim 45 wherein the charge control agent is colourless.

47. A process according to claims 45 or 46 wherein the charge control agent is milled with the colorant.

48. A process according to any one of claims 35 to 47 wherein the preparation of the wax dispersion comprises the mixing together of the wax with an ionic surfactant.

49. A process according to any of claims 35 to 48 wherein the preparation of the colorant dispersion comprises the milling together of the colorant with an ionic surfactant.

50. A process according to claims 43, 48 and 49 wherein the dispersions of latex, colorant, wax, and charge control agent where present, have the same sign charge on the surfactant.

51. A process according to claim 50 wherein the surfactant present in the dispersions contains a group which can be converted from an ionic to a non-ionic form and vice versa by adjustment of pH.

52. A process according to claim 51 wherein the surfactant contains a carboxylic acid group and the dispersions are mixed in step (iv) at neutral to high pH and the flocculation step (v) is then effected by reduction of pH.

53. A process according to claim 51 wherein the surfactant contains a tertiary amine group and the dispersions are mixed in step (iv) at neutral to low pH and the flocculation step (v) is then effected by increase of pH.

SMC 60510

54. A process according to any one of claims 42-53 wherein the surface additives comprise one of the following: (i) hydrophobised silica ; (ii) large and small particle size silica which may optionally be hydrophobised (iii) hydrophobised silica and one or both of hydrophobised titania and hydrophilic or hydrophobised alumina ; (iv) large and small particle size silica and one or both of hydrophobised titania and hydrophilic or hydrophobised alumina.

55. A toner for developing an electrostatic image which has been obtained by the process of any one of claims 35-54.
